# BACKGROUND

<https://datareportal.com/reports/digital-2025-sub-section-global-advertising-trends>

In 2024, the global **advertising** market reached a total spending of **\$1.1T**, with the **digital advertising** sector accounting for over **70% (\$790B)**. This represents a **7.3% increase** compared to the previous year.

In the **U.S.** market alone, digital ad spending amounted to **\$258.6B** in 2024, marking a **14.9%** year over year **growth**.

Notably, the rise of **programmatic advertising** has been remarkable, with programmatic ad spending reaching **\$650B** in 2024.

# Field Research

# Google AdSense : Ads Field Research

## Revenue Model

Operates on CPC (Cost Per Click) and CPM (Cost Per Thousand Impressions) auction models. Advertisers bid through Google Ads and pay when clicks or impressions occur. Google shares about 68% of ad revenue with publishers.

## Target Users

Advertisers: Businesses and SMEs using Google Ads across all industries.

Publishers: Website owners, bloggers, and media outlets monetizing site traffic.

End Users: Global internet users - Google's ad network reaches over 90% of web users worldwide.

## Amazon Ads : Ads Field Research

### Revenue Model

Primarily PPC (Pay Per Click) based on keyword auctions. Sponsored Products and Brands use CPC pricing, while Amazon DSP also supports CPM (impression based) deals. Advertisers manage budget and bids flexibly, with metrics like ACoS (Advertising Cost of Sales) to measure ROI.

### Target Users

Advertisers: Amazon sellers, brands, and vendors, from small merchants to global companies. Non-Amazon brands can also advertise via Amazon DSP.

End Users: Amazon shoppers (300M+ active accounts worldwide) with strong purchase intent, offering highly conversion driven exposure.

# Instagram Ads : Ads Field Research

## Revenue Model

Runs on an auction based model supporting CPC (Cost Per Click), CPM (Cost Per Thousand Impressions), and CPE (Cost Per Engagement). Pricing varies by campaign goal (clicks, installs, reach). Meta's algorithm optimizes delivery based on bid and ad quality. Flexible pricing allows campaigns starting from as low as \$5/day.

## Target Users

Advertisers: From startups and small businesses to global brands, mainly in fashion, beauty, food, and app services targeting younger audiences.

End Users: Instagram users (1.6B+ monthly active users), primarily ages 18-34, making it ideal for Millennial and Gen Z marketing with high engagement rates.

## **Problem** : What about Ads Viewers?

Currently, advertising platforms redistribute revenue only between advertisers and publishers, while the ad viewers who actually consumes the ads receive no reward at all.

Shouldn't the ones who spend time watching countless ads also share in the value they create?

# Reward Field Research

## Swagbucks

Earn points through activities such as watching video ads, online shopping cashback, surveys, and web searches.

## InboxDollars

Generate earnings through activities including watching videos, reading sponsored emails, surveys, and playing games.

## PrizeRebel

Key sources of earnings include watching short video ads, surveys, and completing microtasks (simple online jobs).

# Reward Field Research / Insight

## Limitation

Current reward platforms rely too heavily on **compensation based structures**, making it difficult to sustain long term user engagement.

Activities such as watching ads or completing surveys remain task oriented and repetitive, lacking elements of gamification or social interaction that could enhance motivation.

As a result, users often **lose interest** after receiving a certain reward and stop using the service.

## Insight

Therefore, it is essential to design features that stimulate intrinsic **motivation** (e.g., challenges, ranking systems, community participation, and growth feedback) to encourage **continuous engagement**.

So, we made

# PROJECT GOAL

We wondered, what if advertisements could **reflect a user's current activity** in real time? Wouldn't that bring back the true meaning of advertising?

That's why we propose a **Chrome extension** that delivers personalized, real time ads tailored to each individual.

Typically, users avoid installing ad extensions, but our service changes that: **users who view ads receive a share of the advertising revenue.**

# Who use “FairAd”?

**Blogger**

Users who want to promote their own blogs or posts.

**Influencer**

Users who want to promote their Instagram or YouTube channels.

**Advister**

Businesses or individuals who want to promote their products, values, or services.

**Ad viewer**

Users who want to receive personalized ad recommendations while also earning money.

# Functions

## Recommendation Logic

- Ads are primarily recommended based on the user's real time activity.
- Additionally, certain themes are manually scheduled by time or date:
  - Lunch/Dinner: Food and beverage recommendations
  - Halloween, Thanksgiving: Holiday-themed product recommendations

## Ad Display Criteria

- For major websites (e.g., Amazon, Netflix, Airbnb, American Airlines), ads are displayed according to predefined categories and themes.
- For uncategorized websites, ads appear approximately every 10 site visits.

## LLM-based Advertising Policy

- Because the system is powered by an LLM based ad recommender, it cannot freely suggest random products.
- Using an MCP (Model Context Protocol) model, only products from paid advertisers are recommended.

# Pricing Plans (for advertisers) *Redistribution of advertising revenue*

Limited Time Offer!  
Get 25% off selected styles move fast before they're gone.

## Premium Plan

Ads feature interactive closing mechanisms designed to increase user engagement. For example, wiping a window or solving a small puzzle to close the ad. Advertisers can also customize the ad’s design, content, and interactive elements directly.

## Pricing Plans (for Users) *Redistribution of advertising revenue*

**Reward level 0**

Ad watch time less than 5 seconds

**Reward level 1**

Ad watch time less than 15 seconds

**Reward level 2**

Clicking the ad link

**We define the people watch the ads less than 5 sec as lvl 0 who doesn't interested in the ads**

# Revenue Model

**Advertiser** choose there ads  
plan to charge their credit

**Users** get reward  
based on their performance

# Revenue Model

*Details in next slide*

Credit Value **1K~10K** is for personal customer such as influencer, blogger, etc

Credit Value **100K~10M** is for business owner such as startup, big company, etc

Our system detect the number of impression and click, to spend credit with below logic

**Consuming Credit = # of Impression + 10 \* # of Click**

Based on AVG Impression and AVG Clicks, we redistribute money with **minimum margin rate 60%**

We set “cost of click” is **100x** more larger than “cost of impression”.

As a result, user can get normally **\$0.00018** per watching, **\$1.33** per clicking

Premium plan always **50%** higher cost and return

# Detail price and expectation of Ads

| Credit | Price(\$) | lvl0(\$) | lvl1(\$) | lvl2(\$) | AVG Impression | AVG Click | Max User Reward |
|--------|-----------|----------|----------|----------|----------------|-----------|-----------------|
